

City of Hermosa Beach, California

Pavement Management Program 2024 Update

January 30, 2025

January 30, 2025

Mr. Heecheol Kwon
Senior Engineer
CITY OF HERMOSA BEACH
1315 Valley Drive
Hermosa Beach, CA 90254

GMU Project 24-198-00

Subject: 2024 Pavement Management Plan (PMP) Update, City of Hermosa Beach, California

Reference: GMU "Proposal to Prepare a Pavement Management Program Update for the City of Hermosa Beach," dated August 14, 2024.

Dear Mr. Kwon:

GMU is pleased to submit this 2024 Pavement Management Plan (PMP) Update Report for The City of Hermosa Beach, California.

A PMP update was performed per the scope of the referenced proposal to assess the current condition of the City's roadway network and to evaluate a funding level that will help optimize the City's roadway network.

The following scope of work was performed consistent with the referenced proposal:

- Reviewed and updated City's pavement network inventory
- Updated City's pavement maintenance and rehabilitation history
- Performed current pavement surface condition assessments
- Conducted Pavement Condition Index (PCI) analysis
- Performed Maintenance and Rehabilitation (M&R) planning and budgetary analysis
- Prepared this report to summarize our work, findings, and recommendations

Streets are one of the costliest assets a City manages. Implementing the pavement funding recommendations provided in this report will help optimize the condition of the roadway network and reduce the overall life cycle cost of the City's streets. Please note that a PMP report should be considered a "network-level" study. Over time, updates to the pavement management plan will be necessary to re-calibrate the predictions with actual pavement performance and project cost information.

CITY OF HERMOSA BEACH

2024 Pavement Management Plan (PMP) Update, City of Hermosa Beach, California

We appreciate the opportunity to provide our services on this project. Should there be any questions, please do not hesitate to contact us at 949-888-6513.

Roger W. Schlierkamp, M.Sc., P.E.
Principal / Director of Pavement Engineering

Amina Mannan, PhD, PE
Senior Engineer

1. EXECUTIVE SUMMARY

Maintaining a roadway network constitutes one of the most significant expenses for any city. To maintain its roadway network strategically and methodically, the city of Hermosa Beach conducts routine pavement management plan updates. Beyond monitoring its roadway network condition, this type of study is used to assist policymakers in making decisions on its pavement maintenance funding levels, as well as to comply with the Los Angeles County MTA (METRO) Pavement Management System (PMS) requirements. This report presents an update to the City's Pavement Management Program (PMP) which was last completed in 2021. It summarizes the findings, conclusions, and recommendations to the city's PMP for the next 10 years.

The City is responsible for maintaining a total of approximately 47.6 centerline miles of streets, comprising of approximately 30.0 centerline miles of local streets, 10.3 miles of collector streets, 6.8 miles of arterial streets, and 0.5 miles of alleyways. To monitor and analyze this vast network of streets and pertinent information, the City utilizes PAVER pavement management software. Pavement distress surveys are performed in compliance with the American Society of Testing and Materials standard ASTM D6433, as required by the METRO.

Table 1 below summarizes the current City of Hermosa Beach network's Pavement Condition Index (PCI) breakdown by functional classification.

Table 1. Network PCI Breakdown by Functional Classification

Functional Classification	Pavement Area (SF)	Centerline Mileage	Weighted Average PCI
Arterial	1,257,049	6.8	70
Collector	1,793,982	10.3	74
Local	3,774,912	30.0	65
Alleyway	33,873	0.5	58
Total	6,859,816	47.6	68

Current Pavement Conditions (PCI)

The current citywide weighted average Pavement Condition Index (PCI) is **68**. The analysis of the City's road network reveals the following condition breakdown:

- **Excellent to Fair:** Approximately 73.5% of the network
- **Fair to Poor:** Approximately 21% of the network
- **Poor to Failed:** The remaining 5.5% of the network

Budget Needs and Allocation

- Identified Needs for Preventative Maintenance, Rehabilitation, and/or Reconstruction:
 - **Current Year:** \$26.1 million
 - **Following Biennial Period:** \$4.7 million
- Available Funds for Preventative Maintenance, Rehabilitation, and/or Reconstruction:
 - **Current Year:** \$1.5 million
 - **Following Biennial Period:** \$3.0 million

Budget Scenarios

Based on the current pavement condition and the discrepancy between required and available funds, the following four (4) budget scenarios were evaluated to develop a ten-year pavement management plan.

Scenario 1: Current Funding Level (\$1.5 million per year)

The City's current annual funding level is \$1.5 million per year, equating to a total of \$15 million over the next 10 years.

With this funding level, the network PCI is expected to decrease from its current 68 to a PCI of 59 by the year 2034. Approximately 7% of the network will be in the "Good" condition category, 49% will be in the "Fair" condition category, and 44% will be in the "Poor" to "Failed" condition categories. The deferred maintenance will increase from \$26.1 million to \$76.6 million.

Scenario 2: Unlimited Budget

To determine the funding required to completely eliminate the maintenance backlog, an "unlimited budget" scenario was analyzed. Under this scenario, the City would need to allocate approximately \$26.1 million in the upcoming year and continue to perform proactive maintenance for the years thereafter. The total funding level for the next 10-year period equates to \$42.3M.

This investment would result in improving the roadway network condition considerably. Specifically, 66% of the street network would be maintained or improved to "Good" condition and 34% in "Fair" condition. If all recommended work is completed within one year, the maintenance backlog would be eliminated, and the citywide weighted average PCI would rise to 86.

Scenario 3: Maintain Current Network PCI at 68 (\$3.1 million per year)

To maintain the current network PCI at 68, the city would need to fund \$3.1 million annually, equating to a total of \$31 million over the next 10 years.

Under this scenario, the street network will consist of approximately 11% of the network will be in the “Good” condition category, 62% will be in the “Fair” condition category, and 27% will be in the “Poor” to “Failed” condition categories. The deferred maintenance will increase from \$26.1 million to \$46.9 million.

Scenario 4: Do Nothing (\$0 million per year)

If no funding is allocated, the PCI is expected to decrease from its current PCI of 68 to a PCI of 45 by year 2034. Approximately 33% of the network will be in the “Fair” condition category, and 67% will be in the “Poor” to “Failed” condition categories. The deferred maintenance will increase from \$26.1 million to \$110.0 million.

Summary of Conclusions and Recommendations

Based on the analysis and results of this study, the following conclusions and recommendations are recommended.

- At the current funding level of \$1.5 million annually, the network PCI will degrade significantly by 9 points by 2034. Consequently, the proportion of “Poor” or worse condition streets will increase from 26% to 44%.
- It is recommended to prevent significant network condition degradation by increasing the funding level to at least \$3.1 million annually (Scenario 3). This funding level is predicted to maintain the current network PCI score of 68 by the end of the analysis period (2034).
- Preserving streets at higher PCI levels will help reduce life cycle costs due to factors such as:
 - Regular maintenance and timely repairs help prevent minor issues from escalating into more severe distress and more expensive repairs.
 - Roads maintained at higher PCI levels tend to offer longer life, reducing the need for more frequent rehabilitation or reconstruction.
- Continuously monitor construction costs for implementation into future pavement management plan updates.
- Continuously update the Maintenance and Rehabilitation (M&R) history of all the streets in the network.

- When specific streets are selected for improvement, project-level studies (e.g., coring, laboratory testing) are recommended to be conducted to develop site-specific pavement recommendations, rather than directly implementing the conceptual treatments outlined in this report.
 - This Pavement Management Plan solely focuses on the surface condition of the pavement and is intended for planning and funding-level estimation purposes. It does not include detailed information typically required for developing project plans and specifications, such as the specific thicknesses of the pavement improvement strategies, which depend on subgrade conditions, existing pavement layer thicknesses, laboratory test results, in-place pavement strength, traffic volumes, and other critical considerations.
- Consider incorporating additional pavement maintenance and rehabilitation strategies that utilize in-place materials, such as Full Depth Reclamation (FDR) or Cold Recycled Asphalt Concrete (AC). These approaches, when carefully planned and implemented on suitable projects, can help reduce overall pavement maintenance and repair costs when well planned.
- Where other types of funding are available to improve safety, accommodate multi-modalism, transit or to enhance capacity, consider incorporating pavement rehabilitation as a project component, thereby extending budget allocation and impact.

2. INTRODUCTION

2.1. Background

Maintaining a citywide street network is a complex undertaking. It involves many layers of information that can have significant impacts on pavement performance and maintenance costs. Some of these layers of information include:

- **Funding:** The funding level impacts the type of repair strategies that can be carried out, the design life of the selected strategy, and the amount of streets that can be improved.
- **Pavement age and work history:** The city's streets were constructed at different times and received various maintenance and rehabilitation activities over time. These differences will impact the pavement's current and future condition.
- **Pavement inventory:** An inventory of streets defines the limits of the study and the City's responsibility. Working with a current pavement inventory allows for a more accurate budget scenario analysis to be conducted.

- **Historical costs for various types of repairs:** Recent pavement maintenance / rehabilitation costs are reviewed and updated to more accurately budget for future pavement maintenance/rehabilitation costs.
- **Current pavement condition:** To objectively rate the pavement's condition, the roadway is surveyed by pavement inspectors in accordance with ASTM D 6433 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys.
- **Predicted pavement condition:** Depending on the available budget, the projected future pavement condition has been analyzed and presented under various scenarios.

The above information was identified, analyzed, and summarized into this 2024 Pavement Management Plan Update report.

2.2 Scope

As described in our proposal dated August 14, 2024, GMU's scope of work for this project included:

- Reviewing and updating City's pavement network inventory
- Updating City's pavement maintenance and rehabilitation history
- Performing current pavement surface condition assessments
- Conducting pavement Condition Index (PCI) analysis
- Performing maintenance and rehabilitation (M&R) planning and budgetary analysis
- Report preparation to summarize our work, findings, and recommendations

3. PAVEMENT MANAGEMENT PLAN (PMP) PROCESS

Pavement management planning is a multi-step and iterative process. The following sections describe the PMP process to outline how it is methodologically approached.

3.1 Street Network Inventory and Database

To evaluate the vast amount of pavement management plan information in an efficient and organized manner, a street network inventory (i.e., database) is first established. This process starts with subdividing the entire roadway network into individual segments or areas, called "sections". A section typically represents a street segment (or individual parking lots), with limits typically defined by intersections. Additional relevant information is added to each section within the database, such as surface area (square feet), work history (last date of last slurry seal or mill/overlay), and last pavement inspection date.

Over time, as pavement construction projects are carried out and the pavement's condition changes due to traffic and environmental influences, the database is updated

with additional information. The additional information, such as changes to the pavement condition index and actual construction costs, helps to further calibrate future pavement condition predictions and construction repair cost estimates.

For the 2024 City of Hermosa Beach PMP update, the established inventory was reviewed, updated, and cross-checked in the field

3.2 Pavement Surface Condition Assessments and Pavement Condition Index

To objectively rate the current condition of the roadway network, GMU performed pavement surface condition assessments in general accordance with American Society of Testing and Materials (ASTM) D6433 “Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys”. Additionally, GMU is pre-qualified by Orange County Transportation Authority (OCTA) to perform pavement surface condition assessments.

To summarize ASTM D6433, this standard test method defines 20 different asphalt concrete pavement distress types and 19 different Portland cement concrete pavement distress types, how to rate and measure them, and how to calculate the Pavement Condition Index (PCI). For asphalt concrete pavements, the 20 different asphalt concrete pavement distress types defined by the test method is summarized as follows:

Asphalt Concrete Pavement Distress Types per ASTM D6433			
1. Alligator or Fatigue Cracking	6. Depression	11. Patching / Utility Cut Patches	16. Shoving
2. Bleeding	7. Edge Cracking	12. Polished Aggregates	17. Slippage Cracking
3. Block Cracking	8. Joint Reflection Cracking	13. Potholes	18. Swell
4. Bumps and Sags	9. Lane/Shoulder Drop-Off	14. Railroad Crossing	19. Raveling
5. Corrugation	10. Longitudinal / Transverse Cracking	15. Rutting	20. Weathering

Figure 1. Summary of Asphalt Concrete Pavement Distress Types Defined by ASTM D6433.

For Portland cement concrete pavements, the 19 different pavement distress types defined by the test method are summarized as follows:

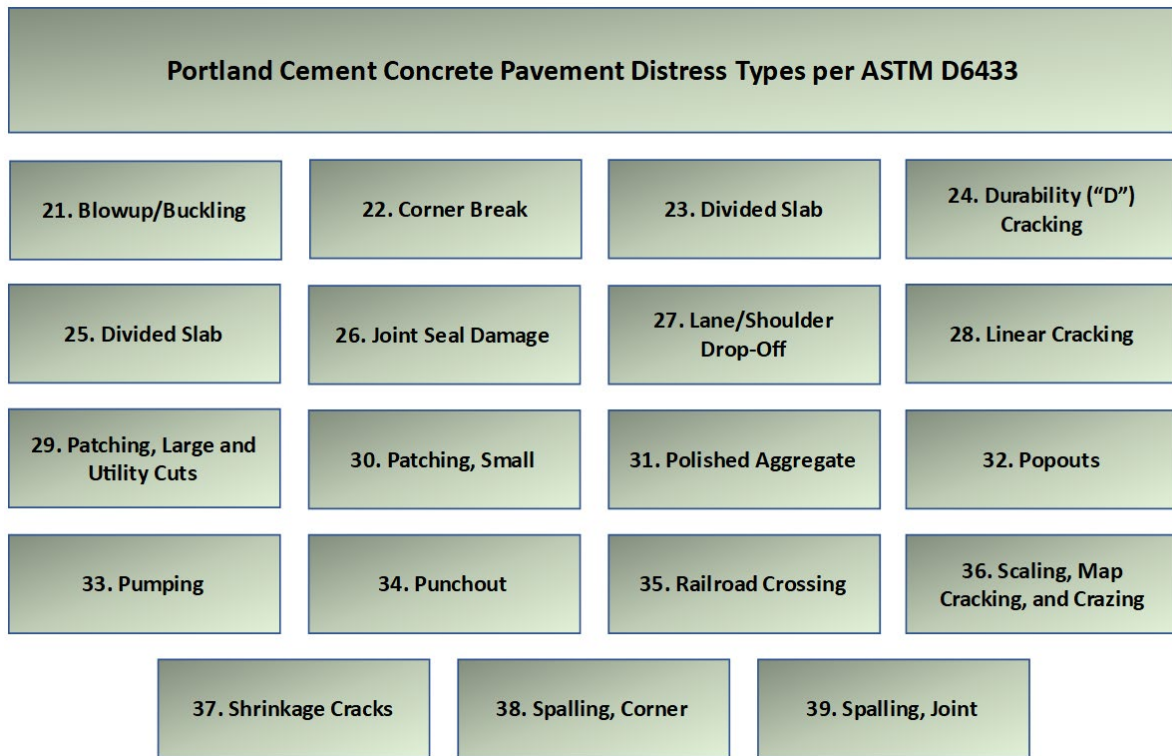

Figure 2. Summary of Portland Cement Concrete Pavement Distress Types Defined by ASTM D6433.

Distress types are typically categorized as either load-related or aging-related. Load-related distresses develop due to the pavement being inadequately thick for the given traffic loads or excess deformation of the underlying subgrade soil. Examples of load-related distress include alligator cracking, depressions, and potholes. Aging-related distresses typically develop due to oxidation and stiffening of the asphalt pavement, which leads to increased brittleness and a tendency for cracking. Examples of typical aging-related distress include longitudinal/transverse cracking and block cracking. Some distresses develop due to a combination of both load- and aging-related factors. Additionally, some distress types can worsen and turn into other, more severe distress types. For example, aging- or materials-related distresses, such as longitudinal cracking, can worsen to load-related distress types, such as alligator cracking.

In addition to identifying the distress type, the severity level of the given distress type is also considered (i.e., low, medium, or high typically), as well as the quantity of each distress type (i.e., square foot or linear foot typically).

The type, extent, and severity level of the distresses identified and measured is used to calculate the Pavement Condition Index (PCI). The PCI is on a 0 to 100 rating scale, where new and properly constructed pavements have a PCI of 100 or close to 100. In general, a street with more distresses, greater quantity of distresses, and higher severity level of distresses will have a lower PCI.

Table 2 summarizes the various condition categories and corresponding PCI ranges and condition descriptions.

Table 2. PCI Condition Categories and Description.

Condition Category	PCI Range	Pavement Condition Description
Good – Excellent	86 – 100	Pavement has little or no surface distress.
Fair – Good	56 – 85	Pavement has some distresses, including both load- and aging-related distresses.
Poor – Fair	41 – 55	Pavement has major distresses, including both significant load- and materials-related distresses.
Failed – Poor	<40	Pavement has a significant amount of major distresses and is at the end of its service life. Pavement has nearly disintegrated and is at or beyond the end of its service life.

Figure 3 presents some photos from the City of Hermosa Beach street network. The photos depict varying levels of pavement surface condition and corresponding PCI.

Figure 3. Examples of City of Hermosa Beach streets and their PCI.

3.3 Maintenance and Rehabilitation Strategy Overview

Maintaining pavement networks at a high level of serviceability (i.e., “Excellent” or “good” condition) reduces the overall life cycle cost of streets. Pavement maintenance treatments (i.e., crack repairs and slurry seal) generally cost approximately \$0.40 to \$0.75 per square foot to perform and helps to preserve the pavement condition by functioning as a “sunblock” for the roadway, resulting in pavement life extension. In contrast, not performing pavement maintenance and instead allowing the pavement to deteriorate to a worse condition leads to more rapid deterioration and shortening of the pavement’s life, at which point it will require more robust and costly repairs. A severely deteriorated roadway typically requires complete replacement (i.e., reconstruction)

which costs approximately \$10.50 to \$14 per square foot to replace. The following figure illustrates this concept.

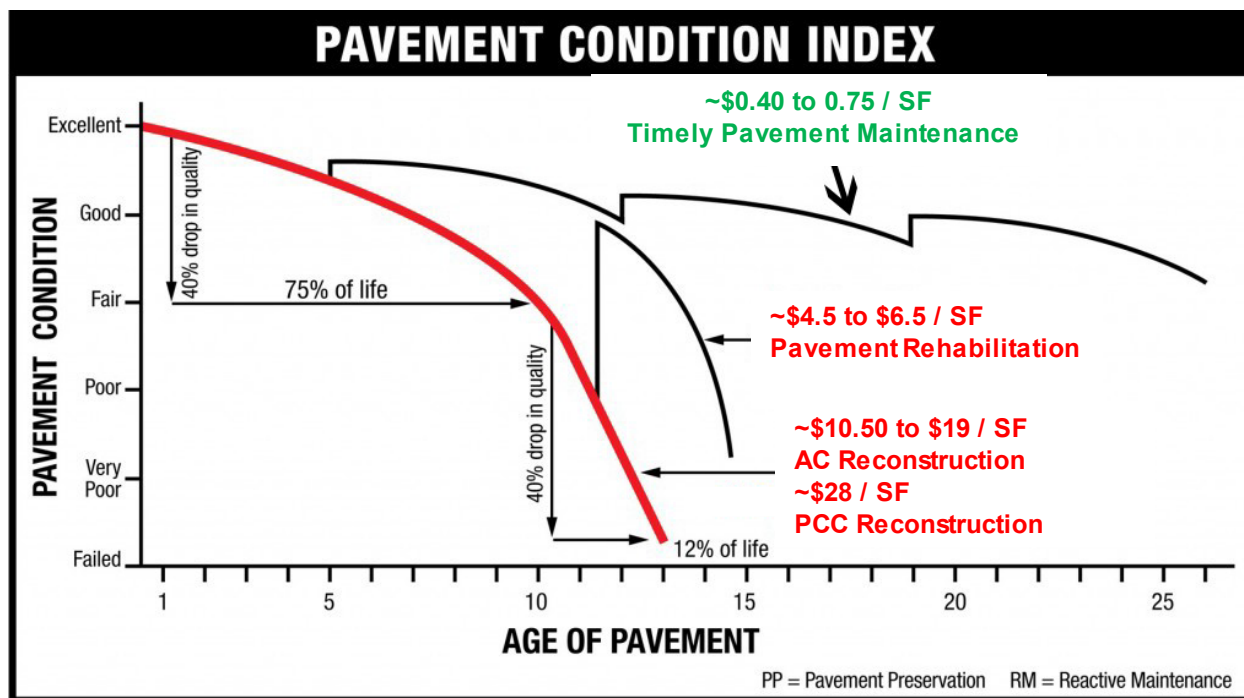

Figure 4. Effect of Applying Maintenance on the Service Life of the Pavement.

As shown by the above figure, performing appropriate and timely pavement maintenance can extend the life of the pavement while also reducing the life cycle cost of the pavement network.

4. PAST MAINTENANCE & REHABILITATION (M&R) ACTIVITIES

GMU reviewed the Maintenance and Rehabilitation (M&R) activities (i.e., work history) performed since the last PMP update, and incorporated such activities into the PMP database, using information provided by the City, including:

- Project plans and specifications
- Project limits
- General repair / treatment types
- Approximate work dates
- Construction cost information or bid results

As per the City's direction, private developments performed on city streets were not included in the PMP database.

Incorporating the M&R history into the PMP is essential. It improves pavement condition predictions and allows more accurate M&R schedules and estimates to be recommended.

Additionally, absent work history information can lead to discrepancies between the predicted PCI and the actual measured PCI.

5. CURRENT PAVEMENT CONDITION INDEX (PCI) RESULTS

Pavement surface condition assessments were conducted in October 2024. After completing the inspections, the collected data was entered into PAVER software, and the PCI was calculated for each section.

Table 3 summarizes the current PCI results and other pertinent information, such as surface area and centerline mileage. Additional current PCI data is presented in **Appendix A**.

Table 3. A Breakdown of the Overall Pavement Network by Condition Category

Condition Category	Pavement Area		PCI (area-weighted average)
	Surf. Area (SF)	Percentage	
Good – Excellent	1,576,010	23.0%	92
Fair – Good	3,460,232	50.4%	69
Poor – Fair	1,454,364	21.2%	50
Failed – Poor	369,210	5.4%	30

A breakdown of the overall City of Hermosa Beach pavement network by condition category is summarized in **Table 4**.

Table 4. A Breakdown of the Overall Pavement Network by Condition Category.

Condition Category	PCI Range	Network	Percent Area of Total Pavement	Area of Pavement (SF)	Percent Centerline Mileage of Network	Centerline Mileage of Network
Good – Excellent	86 – 100	Arterial	6.2%	424,965	22.0%	2.2
		Collector	9.1%	622,451		3.6
		Local	8.2%	560,185		4.8
		Alleyway	0.2%	10,786		0.2
Fair – Good	56 – 85	Arterial	8.0%	550,302	51.8%	3.0
		Collector	11.9%	816,383		4.7
		Local	29.9%	2,054,071		16.5
		Alleyway	0.1%	9,813		0.1
Poor – Fair	41 – 55	Arterial	4.1%	281,782	20.3%	1.5
		Collector	5.0%	345,468		1.9
		Local	11.9%	819,420		6.2
		Alleyway	0.0%	0		0.0
Failed – Poor	<40	Arterial	0.0%	0	5.9%	0.0
		Collector	0.1%	9,680		0.1
		Local	5.0%	341,236		2.5
		Alleyway	0.3%	13,274		0.2
TOTAL			100%	6,859,816	100%	47.6

A graphical representation of the pavement condition breakdown by PCI condition category is shown in **Figure 5**.

Figure 5. Pavement Condition Breakdown (by surface area).

6. MAINTENANCE/REHABILITATION STRATEGY

The following conceptual pavement repair strategies are utilized for the budget-scenario analysis presented in **Section 7** of this report.

- Pavements in “**excellent**” or “**good**” condition categories are typically identified for **maintenance**, which generally consists of **crack repairs and slurry seal**.

For optimal performance, slurry seals are applied on streets in these condition categories to help preserve the condition of the roadway. These treatments help seal minor surface cracks as well as serve as a protective surface membrane, acting as a “sunblock” for the roadway surface. When properly applied and on a suitable-condition pavement surface, slurry seals typically last approximately 5 to 7 years.

Pavement maintenance treatments applied on streets that are in unsuitable condition (worse than “good”) will result in reduced performance of the treatment and protection of the underlying structural pavement section.

- Over time, as the pavement ages and deteriorates, its condition will worsen to a “**fair**” condition, and maintenance treatments will no longer be sufficient. At this stage, the pavement will exhibit signs of significant aging-related distress and

some load-related distress, such as alligator cracking.

Streets that deteriorate to this condition are typically identified for **rehabilitation**, which generally consists of performing a **2-inch or 3-inch thick mill-and-overlay, with a pavement reflective cracking limiting system** to reduce pavement reflective cracking propagation potential. Localized areas of repair (i.e., patches) may also be required to address localized areas of load-related (i.e., alligator cracked) distresses. Mill-and-overlays are typically performed once every 15 to 20 years.

- **Reconstruction:** If streets are deteriorating more rapidly than expected or if maintenance maintenance/rehabilitation is neglected, they can deteriorate to a “**very poor**” or worse condition category.

Streets that deteriorate to this condition are typically identified for **reconstruction**, which generally includes performing **full-depth reclamation or remove-and-replace reconstruction**.

When establishing the unit costs, which are used for budget scenario analysis as described in **Section 7** of this report, GMU reviewed and considered past pavement project costs in the City of Hermosa Beach. We recommend re-calibrating the unit cost values with the actual pavement repair costs to be received when future projects are executed. Changes to the unit costs used in the analysis will influence the results of the budget scenario analysis presented in **Section 7 Budget Scenario Analysis and Results**.

7. BUDGET SCENARIOS ANALYSIS AND RESULTS

Various “what if” scenarios were analyzed to determine the resulting budget needs or resulting pavement condition for the considered budget scenario. Four (4) budget scenarios were analyzed, summarized as follows:

- Scenario 1 – Current Funding Level
- Scenario 2 – Unlimited Budget
- Scenario 3 – Maintain Current Network PCI at 68
- Scenario 4 – Do Nothing

An analysis period of 10 years was considered for each scenario to help with future budgeting purposes and setting expectations for pavement performance.

All Cities have a defined budget for pavement maintenance and repairs. Repairs that are required based on the roadway’s condition but cannot be afforded, due to budget limitations, are referred to as “deferred maintenance”. The cost of the deferred

maintenance that cannot be performed due to funding limitations is referred to as “unfunded backlog”.

Deferring more maintenance over time will eventually lead to increased frequency of additional maintenance or emergency repairs, as well as complaints from users. Deferring maintenance will also increase future repair costs because it is more costly to repair streets in poorer condition.

7.1 Scenario 1 – Current Funding Level

The current allocated annual budget for City of Hermosa Beach roadway rehabilitation projects is \$1.5 million.

By 2034, approximately 7% of the network will be in the “Good” condition category, 49% will be in the “Fair” condition category, and 44% will be in the “Poor” to “Failed” condition categories. The deferred maintenance will increase to \$76.6 million.

Under this funding scenario, the network PCI is projected to decline from the current 68 to 59 by year 2034, representing a significant 9-point reduction. For additional context, refer to **Section 7.3 - Scenario 3**, which outlines the funding level required to maintain the network PCI at its current condition. Scenario 3 indicates that an annual budget of \$3.1 million would be necessary to achieve this goal. A detailed summary of the work type and associated costs is presented in **Appendix B**.

The following **Figure 6** summarizes the resulting pavement condition index and the unfunded backlog.

Year	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Budget (\$M)		1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5
Deferred Maintenance (\$M)	26.1	24.6	29.8	36.6	44.7	52.5	59.9	65.0	69.9	73.6	76.6
Predicted PCI	68	70	69	67	66	65	64	62	61	60	59

Figure 6. Scenario 1 – Current Funding Scenario.

7.2 Scenario 2 – Unlimited Budget

The unlimited budget scenario identifies the total funding required to eliminate the current backlog. The funding level requires \$26.1M in the first year, followed by an average annual cost of approximately \$1.8M over the subsequent 9 years. Over a 10-year period, the total funding required is \$42.3M.

Under this scenario, the street network would consist of approximately 66% in "Good" condition and 34% in "Fair" condition. A detailed summary of the work types and associated costs for this scenario is also provided in **Appendix B**.

The following **Figure 7** summarizes the resulting pavement condition index and the unfunded backlog.

Year	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Budget (\$M)		26.1	2.1	2.6	3.1	2.7	2.6	0.5	0.8	0.6	1.2
Deferred Maintenance (\$M)	26.1	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Predicted PCI	68	86	86	86	86	86	86	84	82	80	79

Figure 7. Scenario 2 – Unlimited Budget at year 1.

7.3 Scenario 3 – Maintain Current Network PCI at 68

To maintain the current network PCI at 68, the City would need to fund \$3.1 million annually over the next ten years. The total required budget over the next 10 years for this scenario is \$31 million.

Under this scenario, the street network will consist of approximately 11% of the network will be in the "Good" condition category, 62% will be in the "Fair" condition category, and 27% will be in the "Poor" to "Failed" condition categories. The deferred maintenance will increase to \$46.9 million by year 2034.

The following **Figure 8** summarizes the resulting pavement condition index and the unfunded backlog.

CITY OF HERMOSA BEACH
2024 Pavement Management Plan (PMP) Update, City of Hermosa Beach, California

Year	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Budget (\$M)		3.1	3.1	3.1	3.1	3.1	3.1	3.1	3.1	3.1	3.1
Deferred Maintenance (\$M)	26.1	23.1	26.5	31.0	36.4	40.9	45.1	47.3	48.1	47.3	46.9
Predicted PCI	68	71	71	71	71	70	70	69	68	68	68

Figure 8. Scenario 3 - Maintain Current Network PCI at 68.

7.4 Scenario 4 – Do Nothing

This scenario illustrates the consequences when no funding is allocated for pavement M&R) over a 10-year period.

By 2034, it is projected that approximately 0% of the network will remain in the "Good" condition category. Around 33% will be classified as "Fair," while 67% will deteriorate into the "Poor" or "Failed" condition categories. Under these conditions, the network's PCI is expected to drop significantly from the current score of 68 to 45, representing a 23-point decrease. The deferred maintenance will increase to \$110.0 million by the year 2034.

The following **Figure 9** summarizes the resulting pavement condition index and the unfunded backlog.

Year	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Budget (\$M)		0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Deferred Maintenance (\$M)	26.1	26.1	32.8	41.2	51.2	61.5	72.1	81.4	91.5	101.5	110.0
Predicted PCI	68	68	65	62	59	57	54	52	49	47	45

Figure 9. Scenario 4 – Do Nothing.

8. PRELIMINARY LIST OF STREETS FOR CRACK SEALING

In addition to the budget scenario analysis, the City has requested recommendations for a preliminary list of streets suitable for crack sealing. Based on a discussion with the City, the criteria used for developing this list include both AC and PCC pavements with a PCI score between 60 and 85 and having one or more of the following distresses:

- **Longitudinal and transverse cracking** (for AC only): Medium severity (crack width $\geq \frac{3}{8}$ inch to 3 inches).
- **Block cracking** (for AC only): Medium and high severity (crack width $\geq \frac{3}{8}$ inch).
- **Edge cracking** (for AC only): Medium severity (crack width $\geq \frac{3}{8}$ inch to 3 inches, with some breakup and raveling).
- **Joint reflective cracking** (for AC only): Medium severity (crack width $\geq \frac{3}{8}$ inch to 3 inches).
- **Linear cracking** (for PCC only): Medium severity (crack width $\geq \frac{1}{2}$ inch to 2 inches).

For a detailed explanation of severity levels for various crack types, refer to the **ASTM D 6433 standard**.

Using these criteria, the preliminary list of streets recommended for crack sealing is provided in **Appendix C**. Furthermore, GMU recommends that the City conduct site visits to verify pavement conditions before finalizing the list, as the condition within the “sample unit” (10% of the street surveyed for PCI determination) may not reflect the condition of the entire street.

For AC pavement, GMU recommends using Crafcro Polyflex III or an equivalent crack sealing product to repair cracks that are ¼ to 1½ inches wide. For PCC pavement, the recommended product is Crafcro Roadsaver 963 Gray Sealant or an equivalent product to repair cracks that are ¼ to 1½ inches wide. For cracks and distresses wider than 1½-inches, GMU recommends a mastic repair, cold patch material, or localized patch repair.

Although outside the scope of this study, GMU suggests preparing a detailed specification to guide crack repair execution. This specification should address critical factors such as crack preparation procedures, settlement or refilling of cracks, additional measures for repairs within pedestrian paths of travel, and other related considerations.

9. LIMITATIONS

Please note, the findings and recommendations presented within this report are based on a visual assessment of the pavement surface and a network-level evaluation (i.e., birds-eye review of the pavement surface condition). The actual rate of pavement deterioration may differ from the predicted rate warranting modifications and updates to the network-level conceptual pavement maintenance/rehabilitation recommendations.

Additional project-level analysis and preparation of project plans and specifications is recommended for each pavement improvement project.

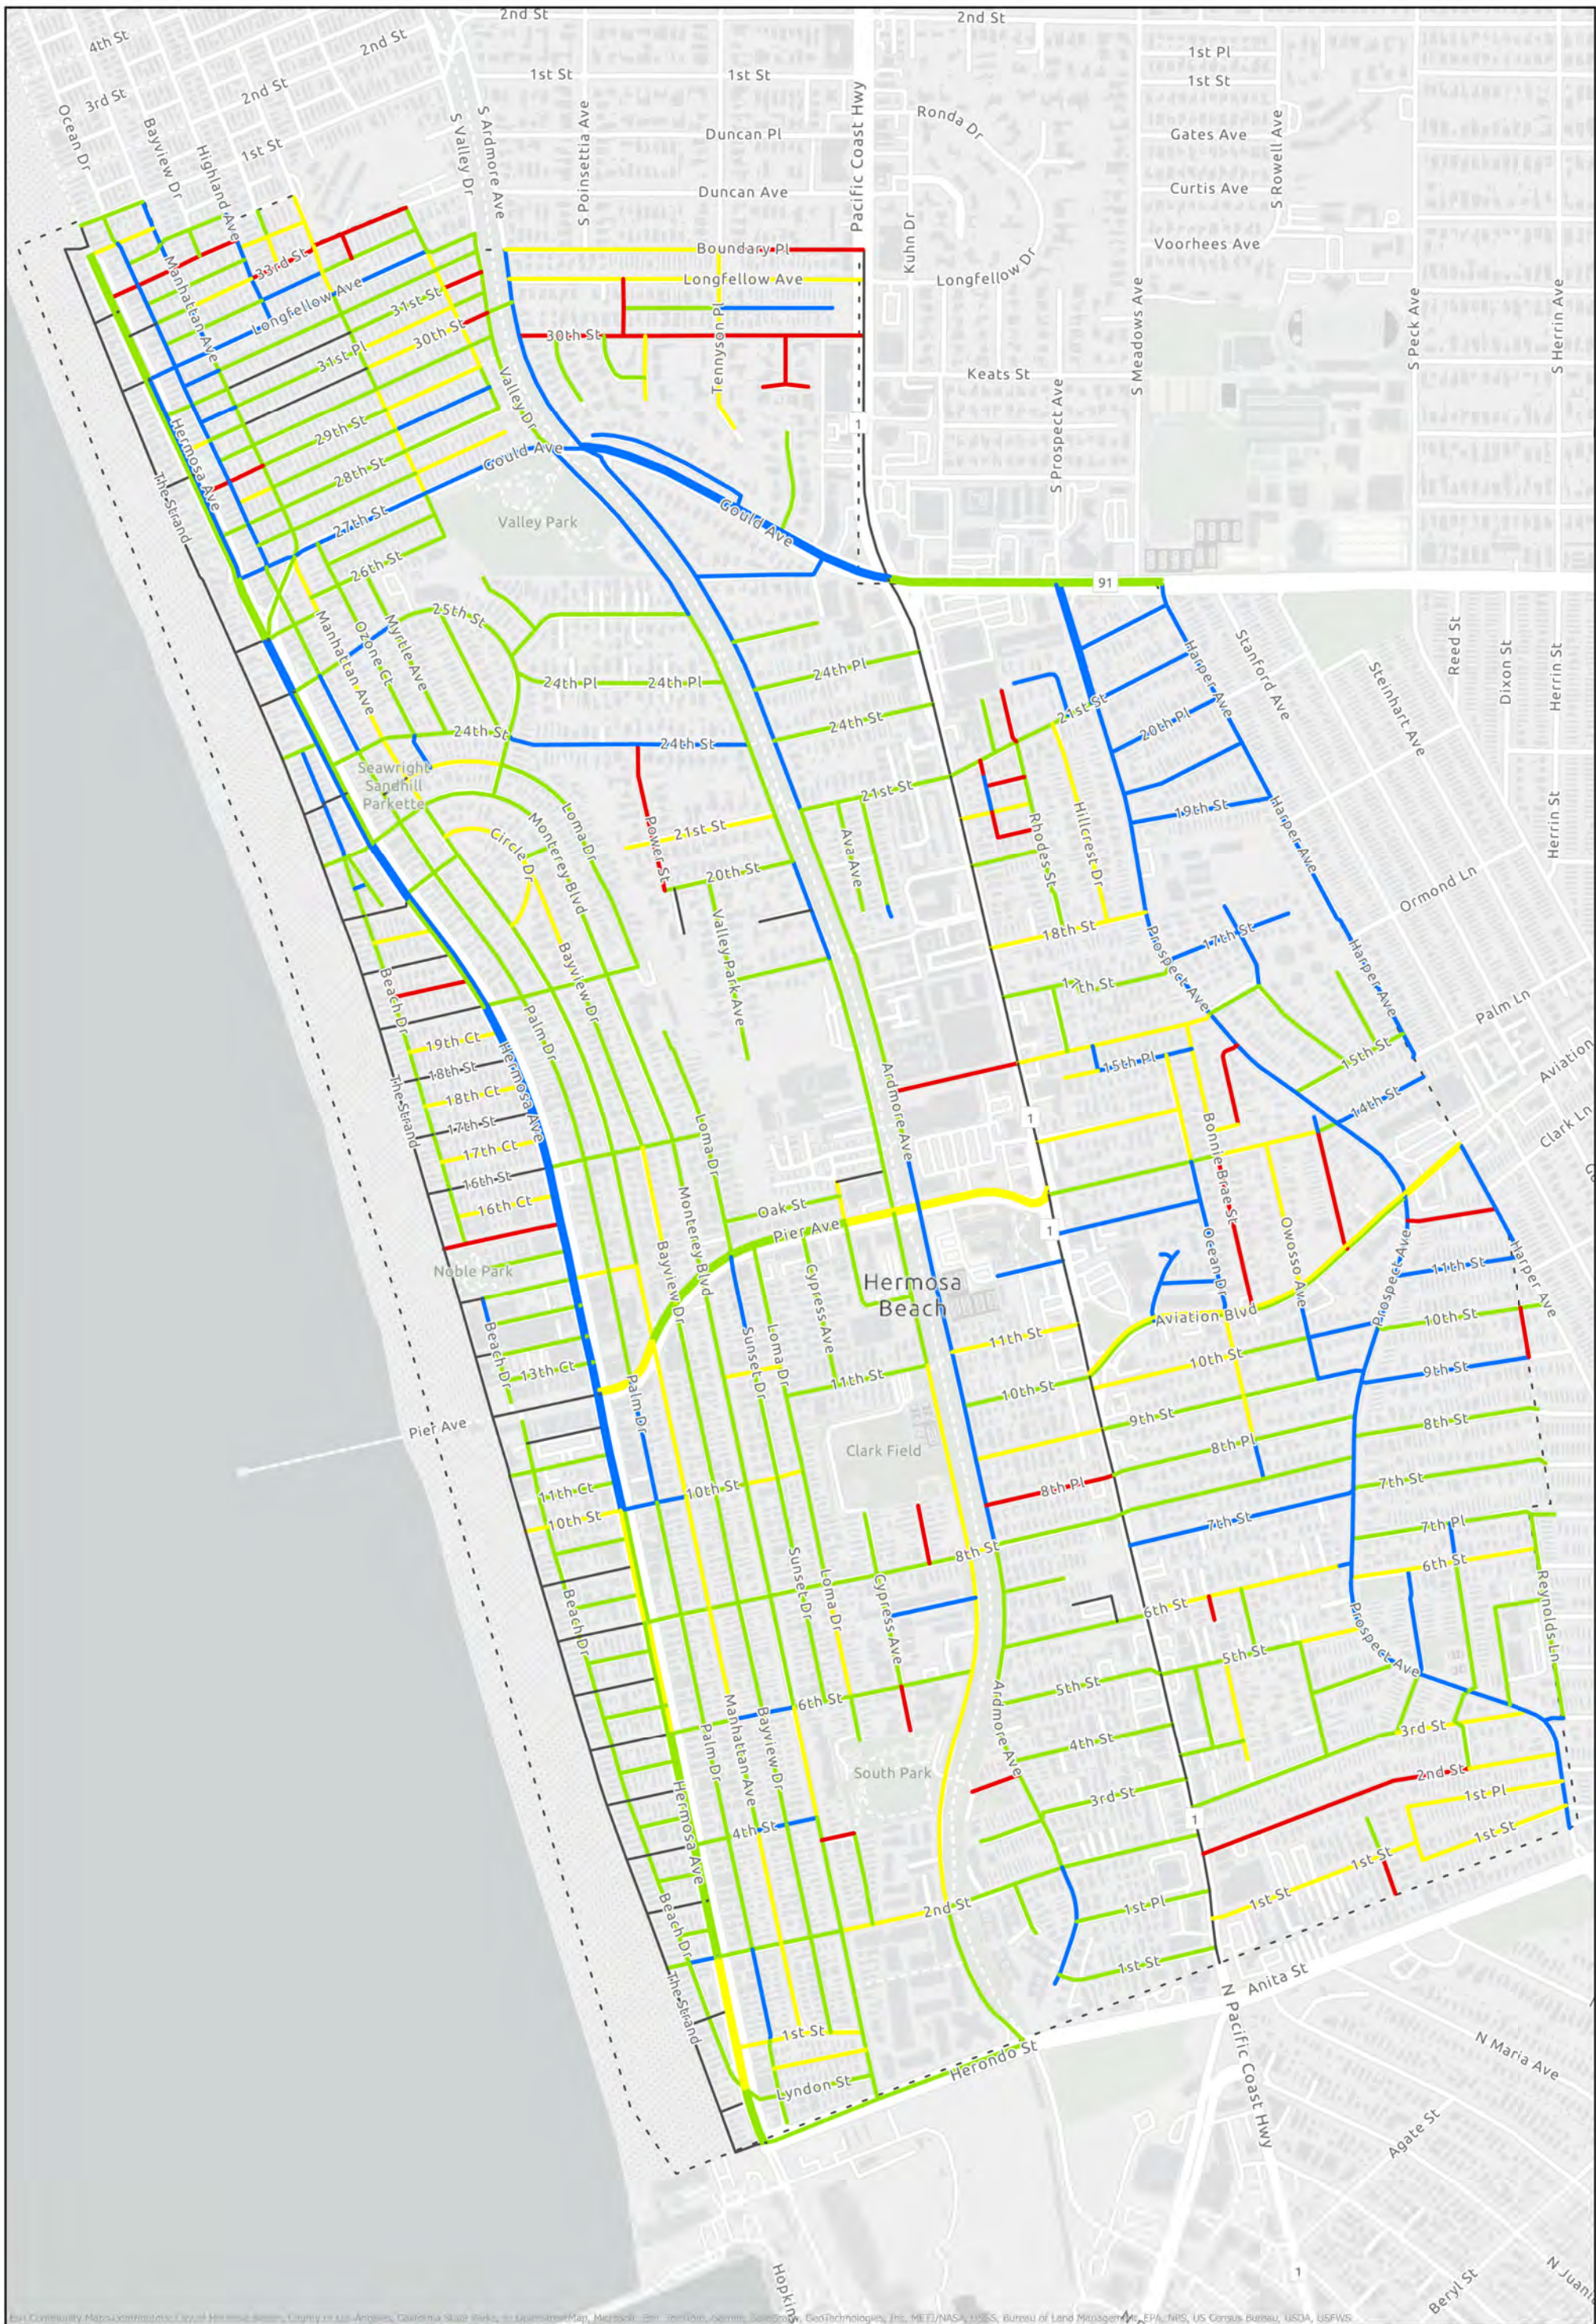

It is important to recognize that the findings, conclusions, and recommendations presented in this report reflect our professional engineering judgment and efforts. No other warranty, express or implied, is provided regarding the conclusions and recommendations contained herein.

This report has been prepared exclusively for the City of Hermosa Beach and is in accordance with generally accepted pavement engineering practices.
